

Earthquake Insurance

We see so often earthquakes happening everywhere else but here in the Northeast. However, this is a misconception because we actually have a handful of earthquakes in the Northeast every year, but usually too small for most of us to feel them.

Are we at risk as much as people who live on the West Coast? I'm sure you know the answer to that. But the fact remains we do have earthquakes and could experience one large enough to damage your home or other personal property at any time. It's important to know that a standard homeowners policy does not cover damage caused by an earthquake. However, you can request the additional coverage and in most cases have it added on your existing policy. To learn more about price and availability contact us or your local agent.

USGS Earthquake Probability Mapping

Want to know the chance an earthquake might hit in your neighborhood? Try this great [Earthquake Probability Mapping Tool](#) from the USGS (United States Geological Survey). Simply type in your zip code or Long and Lat coordinates, size of quake and how long in the future you want to predict. The tool returns an interactive map showing the probability of an earthquake hitting your area.

Earthquake Watch

Below is an interactive map displaying earthquakes that have occurred in the past 24 hours or 7 days throughout the globe. Click 'See What's Shaking' to start tracking recent earthquakes.
